

VizSchema – python & visit example use for gyro data, VsH5File.py API, schema specification issues

D. A. Dimitrov

(some notes on the current Python API for reading VizShema h5 data, May 10, 2011)

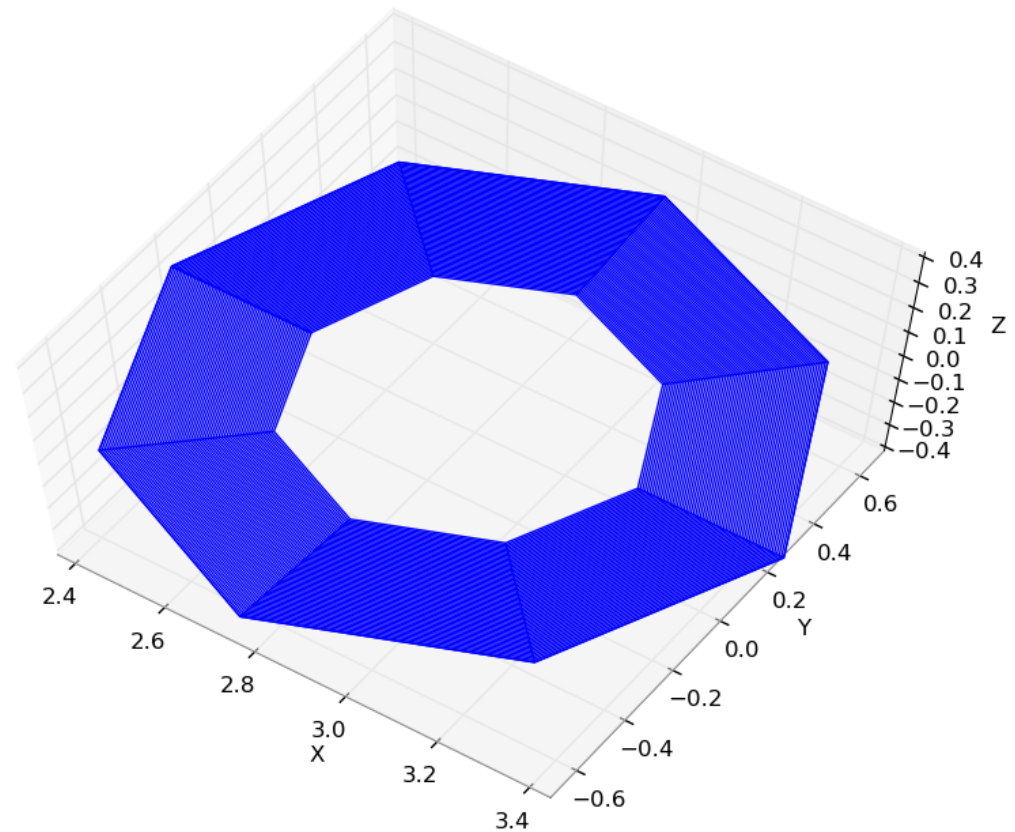

Gyro data used & their vizSchema compliant data

- /scr_oxygen/srinath/gyroruns/nl01/gyro00300.h5
- /scr_oxygen/srinath/gyroruns/nl01/gyro3D00300.h5
- VizSchema data:
 - both files contain a mesh dataset /cartMesh
 - both files contain “objects” (HDF5 datasets) with metadata that have attributes starting with “vs”
 - however, there are also datasets that do not have attributes starting with “vs” – these datasets are ignored by the VsH5File.py python API.

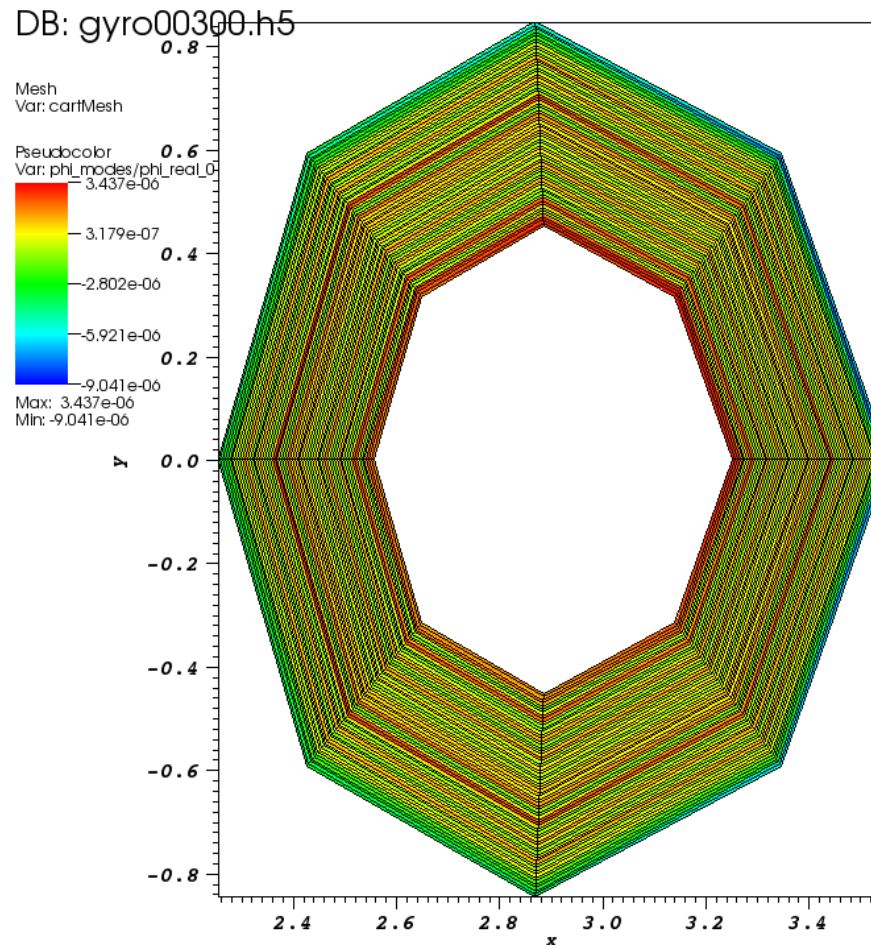

Plotting the mesh from python

- Using VsH5File.py to read the data and matplotlib to plot it
- The '/cartMesh' mesh data is obtained via one of the datasets '/phi_modes/phi_imag' that has a handle for the mesh associated with it.

Plotting the mesh and the phi_imag mode data from visit

- Both examples use data from the gyro00300.h5 file.

Python source code that demonstrates using VsH5File.py

```
from numpy import *
import pylab as p
import VsH5File
import mpl_toolkits.mplot3d.axes3d as p3
fileName = "gyro00300.h5"
vd = VsH5File.VsH5File(fileName)
vd.findDataSets()
md = vd.getDataSet('/phi_modes/phi_imag')
cartMesh = md.mesh.node
x = cartMesh[... , 0]
y = cartMesh[... , 1]
z = zeros(x.shape)
vd.close()
fig=p.figure()
ax = p3.Axes3D(fig)
ax.plot_wireframe(x,y,z)
ax.set_xlabel('X')
ax.set_ylabel('Y')
ax.set_zlabel('Z')
p.show()
```

```
Import ...
fileName = "gyro3D00300.h5"
vd = VsH5File.VsH5File(fileName)
vd.findDataSets()
md = vd.getDataSet('/v_par_ion0')
cartMesh = md.mesh.node
x = cartMesh[... , 0]
y = cartMesh[... , 1]
z = cartMesh[... , 2]
x = x.reshape((x.shape[0], x.shape[1]*x.shape[2]))
y = y.reshape((y.shape[0], y.shape[1]*y.shape[2]))
z = z.reshape((z.shape[0], z.shape[1]*z.shape[2]))
vd.close()
fig=p.figure()
ax = p3.Axes3D(fig)
ax.plot_wireframe(x,y,z)
ax.set_xlabel('X')
ax.set_ylabel('Y')
ax.set_zlabel('Z')
p.show()
```

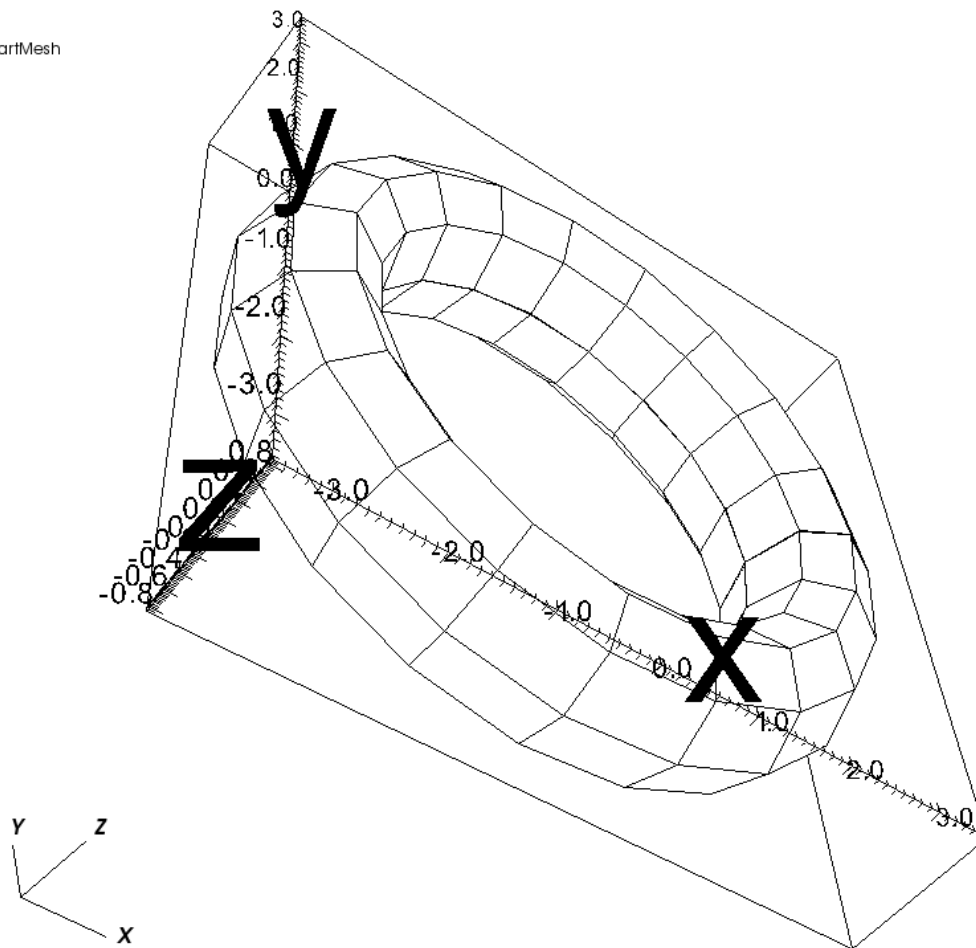

Plotting the full 3D mesh using visit...

- 3D examples use data from the gyro3D00300.h5 file.

DB: gyro3D00000.h5

... and from Python.

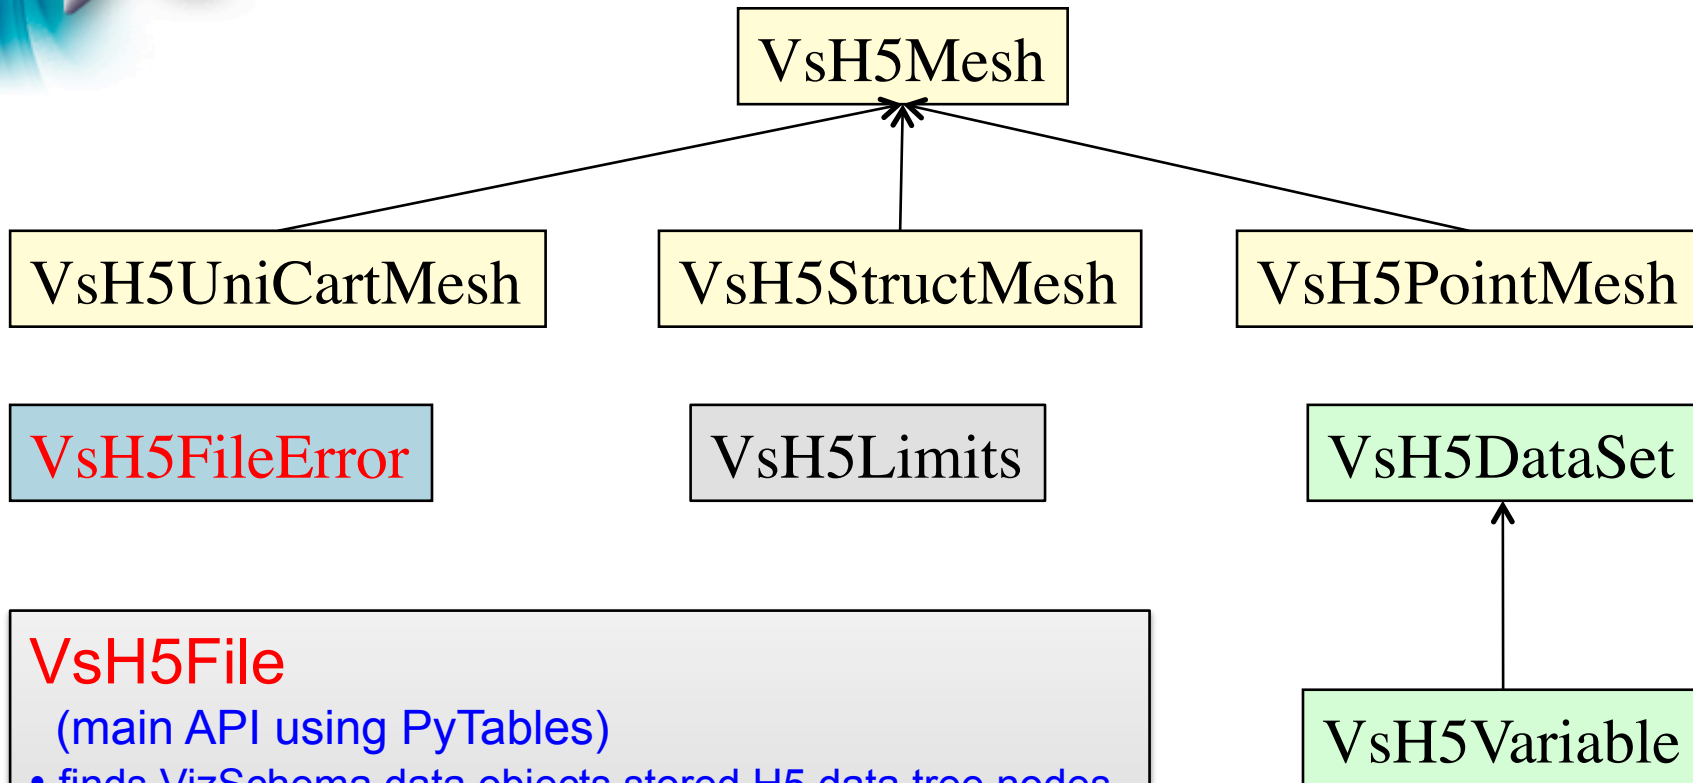

- 3D examples use data from the gyro3D00300.h5 file.

ATION

VsH5File.py python API - classes

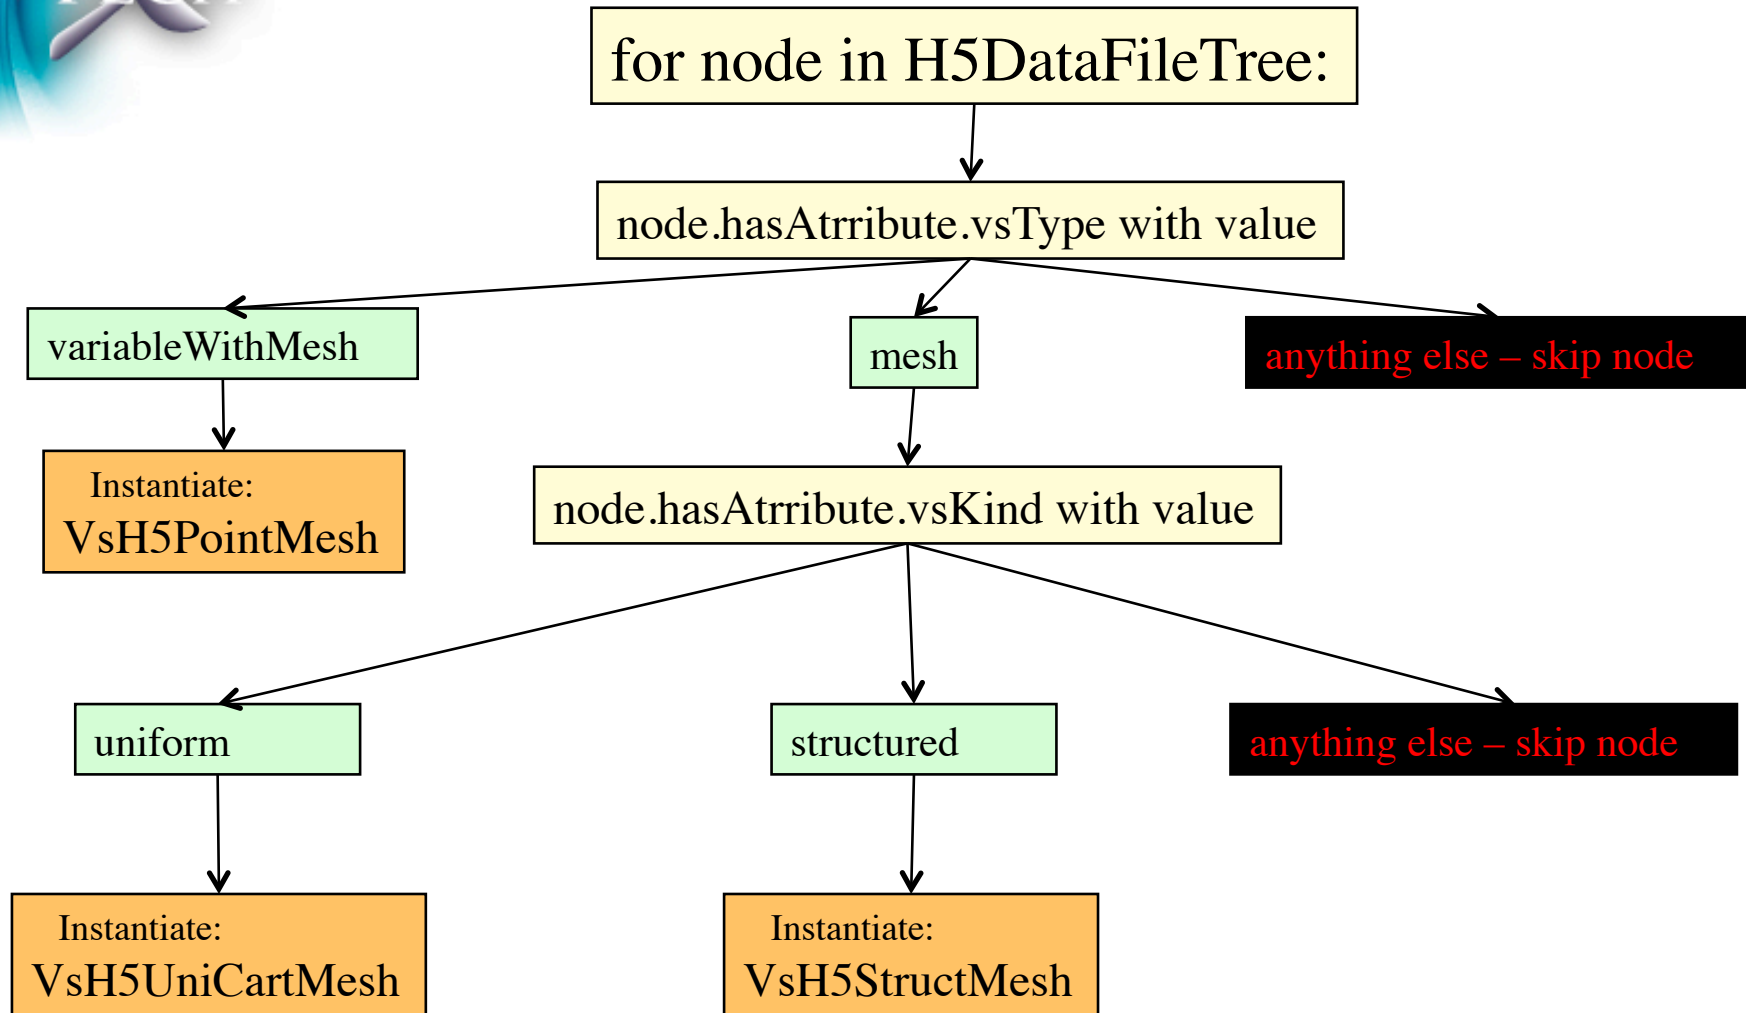

VsH5File

(main API using PyTables)

- finds VizSchema data objects stored H5 data tree nodes, instantiates VsH5Mesh and VsH5DataSet objects
- stores the meshes and data sets in dictionary data structures
- provides access to them with the raw data represented via numpy arrays.

VsH5File.py python API – VizSchma supported meshes

VizSchema specification and compliance questions

- What are the requirements on the official specification of VizSchema?
- How should the VizSchema specification be represented: XML, RDF/OWL, anything else?
- What should it mean for an h5 file to be VizSchema compliant? Currently, VsH5FileError is not thrown if an h5 file does not have a mesh object and datasets are attempted to be read in (python will generated an error since the mesh map is empty).
 - should partial VizSchema compliance be supported (effectively the current state)?
 - or strong compliance should be enforced?
 - or strong compliance should be enforced for required data and optional data be allowed as well.
